3. HTTP Response Object Properties and Methods

Response Object provides multiple properties to give more information about the HTTP Response.

- status (number) - HTTP status code
- statusText (string) - Status text as reported by the server, e.g. "Unauthorized"
- headers
- url
- text() - Getting text from response
- json() - Parses the response as JSON

For example,

```javascript
let options = {
  method: "GET"
};

fetch("https://gorest.co.in/public-api/users", options)
  .then(function(response) {
    return response.status;
  })
  .then(function(status) {
    console.log(status);  // 200
  });
```

In the above example, we can get the response status as

`200` when the request is success.
